

Can a dual-core optical module be used

Overview

Short answer: Usually yes, you use them in pairs, but the “pair” can be a media converter on one end and a fiber switch (or SFP in a switch) on the other, as long as both sides speak the same speed, wavelength, and optical mode. Single fiber modules (BiDi) use one fiber for both transmitting and receiving data. In DWDM implementations, each direction of communication occupies a dedicated fiber, improving the stability of the transmission. Multi-mode links can be used for data rates up to 800 Gbit/s. BiDi module only has 1 port, wave filtering through the filter of module, and finished the transmitting of 1310nm optical signal. In today's communication field, single-core optical fibre and dual-core optical fibre are like remarkable stars, the powerful technology behind them and the disruptive impact on the communication industry deserve everyone's attention and discussion. However, many people often have a vague.
