

## Can micro-cables and regular optical cables be fused together

### Overview

Conventional fiber fusion processes like arc and filament splicing are limited to connecting optical fibers of similar geometries and materials. There commonly is a limit of 1mm for the maximum diameter of fused components, so micro-optical lenses or gradient index (GRIN) lenses cannot be. They allow two or more fiber optic cables to be connected, as well as split and combine signals. In this blog post, we will discuss how these devices work and their various benefits. By the end of this. Regardless of the purpose of your cable splicing, the goal is always the same: To join two optical fibers together in a way that's strong, secure and high-performing to ensure excellent signal transmission from one cable to the next. Splicing is most commonly used in the field but has application in cable assembly houses. This apparatus features two sides mounted with an electrode each, a control panel, and a digital screen to align the fiber optic strands.
