

## Direct connection to optical cable

### Overview

A Direct Attach Cable is a type of factory terminated twinax cable that connects directly into transceivers. These cables are comprised of permanent lengths of shielded copper coaxial with pluggable transceivers on either end, available in a range of lengths (for short distances) up to 100 meters. In the networking industry, these cables are usually referred to as DACs. In general, the connectors of a DAC cannot be separated from the copper cables they connect. DACs transmit data in the form of electrical signals. The ONT is a crucial component in fiber-optic communications, serving as the endpoint of a fiber-optic network and converting optical signals into electrical signals that can be understood by devices such as computers and routers. In this article, we will delve into the world of ONTs, exploring the following products: Active Optical Cables (AOCs) use optical fibers for high-speed data transmission and include active components such as optical transmitters and receivers. Passive DAC cables use less power and are cheaper. They work well for up to 7 meters.
