

## General Switch Aggregation

### Overview

Switch aggregation is transforming how networks handle data traffic. By combining multiple switches into a cohesive system, organizations can improve efficiency, scalability, and management. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. Function: Connection point for all devices on a segment of segment of a network that breaks down and absorbs the data flow between all of the connected devices rather than flooding it to all connected devices. The aggregation layer serves as the convergence point for multiple access layer switches and is responsible for handling all. Switch aggregation, also known as link aggregation or trunking, is a method used in computer networking to combine (aggregate) multiple network connections in parallel. This arrangement increases throughput beyond what a single relationship could sustain, offers redundancy in case one of the links. The aggregation (sometimes also called distribution) layer is a real crossroad. It facilitates the connectivity because it would rapidly become impractical to.
