

How to use a centralized computer room terminal box

Overview

Centralized computing is computing done at a central location, using terminals that are attached to a central computer. The computer itself may control all the peripherals directly (if they are physically connected to the central computer), or they may be attached via a terminal server. Alternatively, if the terminals have the capability, they may be able to connect to the central computer over the net. HistoryThe very first computers did not have separate terminals as such; their primitive input/output devices were built in. However, soon it was found to be extremely useful for multiple people to be able to use a computer a. As of 2007, centralized computing is now coming back into fashion – to a certain extent. Cloud computing has had an important role in the return of centralized computing. have been used for many year. Some organizations use a model partway between centralized computing and conventional desktop computing, in which some applications (such as) are run locally, while other.
