

How will optical cables be used in the future

Overview

With everyone demanding faster and more reliable internet, 2025 is set to be a big year for innovations that boost efficiency, dependability, and scalability in Fiber Optics. These upgrades aren't just important for telecoms; they also have huge implications for high-tech. Unlike electrical signals sent via copper cables, optical signals use light pulses to carry large volumes of data at incredible speeds. This technology is considered the future of communication, offering numerous advantages over traditional methods. Plastic optical fiber, or POF, offers a budget friendly option compared to those traditional glass fiber optic cables we've all become familiar with, especially when dealing with short distance data transfers. The material itself costs less upfront and doesn't require specialized tools for. Fiber optic cables are strands of ultra-thin glass or plastic fibers that transmit data using light signals instead of electrical currents.
