

Inspection sequence of relay protection devices

Overview

A comprehensive testing program should simulate fault and normal operating conditions of the relay. Setting determines pick-up value/time. Tests are conducted by the manufacturer at manufacturer's works, and by the user at site during commissioning and periodic maintenance. These tests are further divided into. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards. Since the basic function of a protection relay is to correctly function under abnormal. The first relays were Electromechanical (EM): machines with moving parts actuated by coils connected to current and voltage sources. 15 seconds in its 30+ year life. But failure to operate as intended can result in extensive damage, extended power outages, and loss of life.
