

Insufficient power in the distribution box causes the circuit breaker to trip

Overview

For a circuit breaker to trip, two conditions must be met: The fault current must reach the set threshold. Therefore, to prevent cascading trips, both current settings and time settings must be properly coordinated. Frequent tripping of your distribution box is a critical alarm, not just an annoyance. For facility managers, electricians, and project owners operating overseas—from industrial plants in the Middle East to solar farms in Southeast Asia—these unexpected shutdowns mean costly downtime, safety risks. When a circuit breaker keeps tripping, the cause usually falls into one of three categories: overloads, short circuits, or ground faults. The key is knowing what's driving each one so you can troubleshoot it correctly. One of the most common reasons a circuit breaker keeps tripping is an overloaded. Very often, the lowest-level circuit breaker does not trip, but the upstream (higher-level) one does! This causes a large-scale power outage! Why does this happen?

Today, we'll discuss this issue. But don't panic! In this guide, we'll dive into what a.
