

Optical Module Steps

Overview

An optical module works at the physical layer of the OSI model and is one of the core components in the fiber communication system. It mainly consists of optoelectronic devices (optical transmitter and optical receiver), functional circuits, and optical bores. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications. Critical Metrics: Signal integrity (insertion loss, return loss) and thermal management are the two. As an important part of fiber-optic communication, an optical module is a photoelectric converter which converts electrical signals into optical signals and vice versa.
