

Optical transmission via switch

Overview

Optical switching is the process of controlling the destination of individual optical information signals. Figure: Optical Switch. Research in this area is driven by the need to switch data streams of higher and higher speed efficiently as customers for computer and communications services demand transmission and switching rates far higher than can be provided by a purely electronic system. Light occurring on an optical transistor's input changes the intensity of light emitted from the transistor's output while output power is supplied by an. Optical switches are photonic devices that control the flow of light. However, more advanced devices can route one. Optical switches can be broadly classified as either opaque or transparent, depending on their implementation technologies.
