

Principle of High-Temperature Temperature Measurement Optical Cable in the Philippines

Overview

In this paper, we describe high-temperature measurement technology with distributed optical fiber sensors employing Brillouin scattering and introduce our efforts to determine the feasibility of this technology for practical use. High-temperature measurements above 1000 °C are critical in harsh environments such as aerospace, metallurgy, fossil fuel, and power production. Fiber-optic high-temperature sensors are gradually replacing traditional electronic sensors due to their small size, resistance to electromagnetic. Since the measuring chain is a functional combination of optical methods, optical fiber properties, and other photonic elements together with control electronic circuits, it is necessary to find a suitable compromise between the chosen measurement method, its measuring range, accuracy, and resolution. This article explores the structure, working principles, advantages, and disadvantages of Fiber Optic Temperature Sensors. The other end of the fiber is attached to a light source. The light source is used to excite the fluorescent material.
