

Relay protection reverse output

Overview

A reverse power relay prevents generators from running in reverse, which can cause damage. It monitors the power supply and activates a trip if the power output drops below a preset value. The SRW is a single phase, solid state, directionally controlled reverse power relay. The SRW is a single phase, solid state, directionally controlled reverse power relay, used primarily to protect ac generators against motoring. The directional unit has a factory preset maximum sensitivity. Reverse active power protection (ANSI 32P) detects, and trips the circuit breaker, when a synchronous power generator connected to an external network, or running in parallel with other generators, operates as a synchronous motor. The most important function of a reverse power relay.
