

Structural Features of Power Distribution Box

Overview

Portable distribution boxes are mainly composed of core components such as shells, circuit breakers, sockets, terminals, leakage protectors, fuses, etc. As a protective "armor", the shell is mostly made of high-strength engineering plastics or aluminum alloys. Its main job is to take the incoming power supply and distribute it to multiple circuits within the building, ensuring that electricity is delivered safely to different areas. It provides convenience for protection, control and maintenance. This. For procurement professionals, electrical contractors, and project managers, choosing the right Distribution Box (DB Box) is a critical decision that directly impacts system safety, reliability, and long-term operating costs.
