### Overview

Distribution boxes work by distributing electrical power. They receive electrical power from the main power line — or another primary power line — and they distribute it via outlets. When electricity is required to be distributed in one or more than one storey building, in this situation mostly a separate energy meter is installed on the ground floor for each floor. The supply wires from every energy meter are ejected and carried to the distribution fuse board of every floor. A power distribution box (also called PDU or distro) directs electricity from a main source to multiple circuits. It acts like a hub or traffic controller, managing power flow to different areas or devices. Key components include circuit breakers, fuses, bus bars, and internal wiring for safety and. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. Yet the distribution box is a highly complex component that not only ensures safe power distribution, but is also responsible for protection in an emergency.
