

The switch light is not as bright as before

Overview

The best way to resolve compatibility issues is by either replacing the lamps or the dimmer switch. You can get that information from the product's spec sheets. Any idea why this happening?

It is phantasmagorically difficult for human eyes to detect. One of the most common reasons why dimmer switches won't dim is because of improper installation. The scope gives an RMS value of 110V when line voltage is 120V. Dimmers operate at around 60°C, which is significantly. Switching to LED lights can revolutionize your home lighting setup, making it much more energy efficient. But if you don't make the right choices, you might find that your new LED bulb isn't as bright as you were expecting, or you might find your LED light suddenly dim, when you were expecting a. BUT, and here's the issue, the lightbulb (this is a lighting circuit, no outlets are connected) seems less bright with the switch turned on vs how it was when it was on the dimmer turned all the way up. This is an incandescent light bulb btw, not LED I'm no master electrician, but I can't see how.
