

What are the supervision functions of relay protection

Overview

Trip circuit supervision monitors and indicates the healthiness of the breaker's tripping circuit and indicates whether or not the circuit breaker will trip at a fault. If not. Protective relays and devices have been developed over 100 years ago to provide "lastline" of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. It detects abnormalities such as open circuits, short circuits, or degraded insulation in the trip coil circuit before a fault occurs, ensuring. While Supervision relays are applied for the supervision of trip circuits and trip coils of circuit breakers, Signalling relays are used to provide a visual indication of the operation of protection functions and contact multiplication.
