

What size wire should be used in a transformer capacitor bank

Overview

Using a simplified lookup table for wire ampacity, the recommended wire size for 208 amps over 100 feet is typically 3/0 AWG (based on adjusted current for length). Proper wire sizing is critical to prevent overheating, electrical fires, and inefficiency in electrical systems. For these banks, bare, or 600 volt conductor may be used. (NEPSI) recommends 600 volt conductor be used, since the thin, 600 volt layer of insulation will tend to protect the copper (if copper wire is used) from corrosion. The NEC (and CEC) requirement is 1.25x factor?

Most capacitors are designed to operate at 135% of their kvar ratings. Capacitor banks play a pivotal role in substations, serving the dual purpose of enhancing the power factor of the system and mitigating harmonics, which ultimately yields a cascade of advantages. The equipment electrical ratings, physical arrangement, and relay protection scheme are intimately intertwined. For more information, please.
